Reduce total cost of ownership through elimination of waste

By giving you complete visibility on software installed vs. actual usage, LanLicenser enables you to purchase, install, upgrade and support the applications actually required by end-users to perform their business duties. This tighter adjustment of application portfolio to business needs will reduce the total ownership cost of your desktops dramatically.

Enterprises that fail to integrate software usage and inventory data to manage their software assets will over-buy licenses for 60 percent of their portfolio and be out of compliance on 30 percent of their portfolio.

Gartner

Achieve license compliance without overpaying

Most firms control software usage by maintaining an inventory of software installed on workstations and servers. They then purchase additional licenses as necessary to ensure compliance. The lack of information about actual usage inevitably results in unnecessary expenditure. With its advanced integrated inventory and metering technology, LanLicenser provides you with the information you need to make informed purchasing decisions and achieve license compliance at the right cost.

Organizations with 1,000 to 3,500 users are saving between US\$500,000 and US\$1,200,000 annually in license fees by metering software.

Gartner

Control desktop usage reliably and cost-effectively

In environments where security and compliance require the control of application usage, rigorous enforcement consumes significant internal IT resources. Furthermore, locking down the desktops can harm users' ability to carry out normal business tasks. LanLicenser proposes an innovative approach to the problem by preventing users from running prohibited software, whatever its source, without altering the desktop configuration. This approach offers 100% reliability at a very low cost.

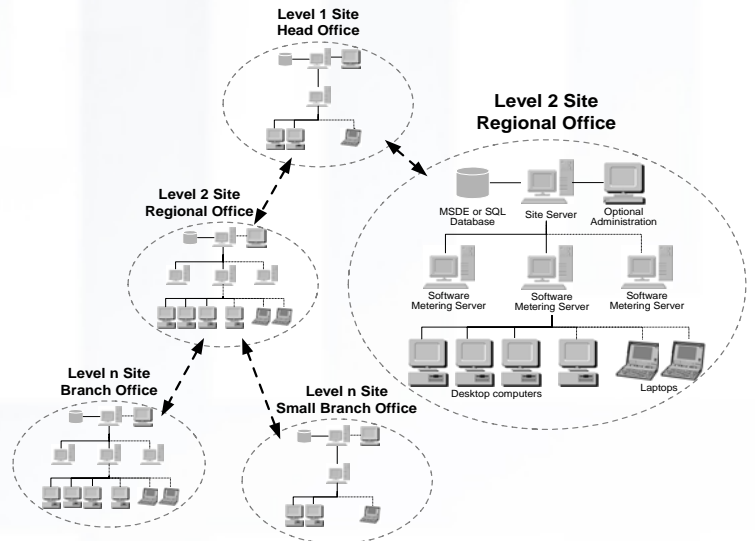

Get better visibility on your costs

LanLicenser provides you with the necessary information to allocate IT resource costs according to actual usage. This is the most effective way to achieve true cost transparency and implement activity-based costing, which leads to more accurate profit and loss accounts.

LanLicenser Architecture: A Typical Organization

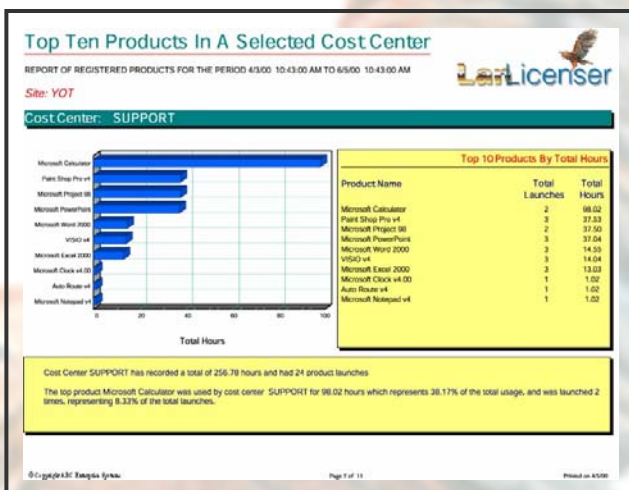

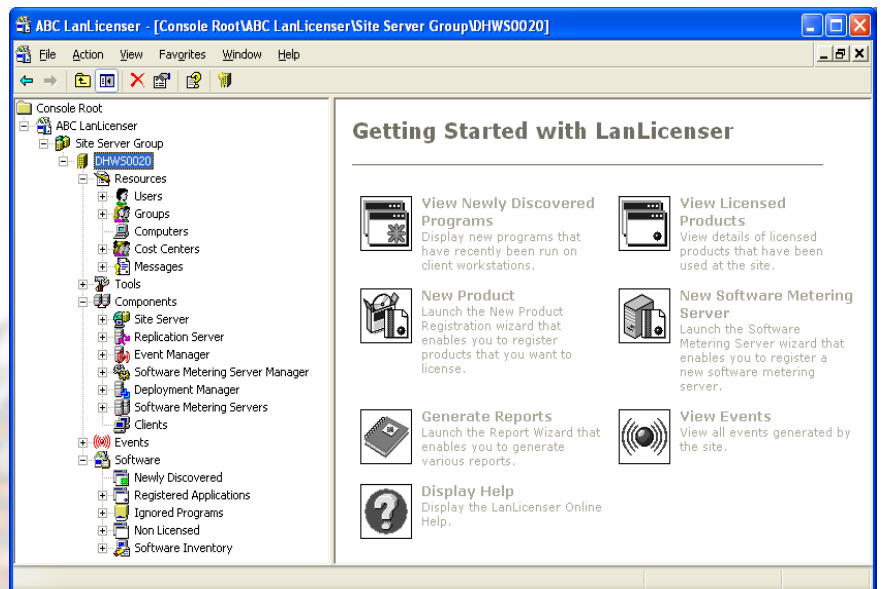

Scalable architecture

LanLicenser has been designed to grow with your business. Its n-tier architecture makes it flexible enough to fit organizations of all types and sizes, be they centralized or distributed over the world. Up to 10,000 clients are supported per software metering server.

Low administration requirements

You won't need an army of system administrators to run LanLicenser. It has been designed to be user-friendly and require minimal training. It is easy and quick to deploy.

Information you can act upon

LanLicenser provides fully customizable reports that enable you to get exactly what you need and want. Our goal is to help you achieve your objectives.
